

Relationships and Joins

Relationships

1. Define relationships
2. Business Scenario (data model diagram)
3. Build a Tableau data source using relationships
4. Answer business questions
5. Learn the interface and functionality
 - Data pane
 - Null values
 - Calculations (single-table and multi-table)
 - Count fields (auto-generated)
6. Performance Options settings (cardinality and referential integrity)

Combine multiple tables for analysis with relationships

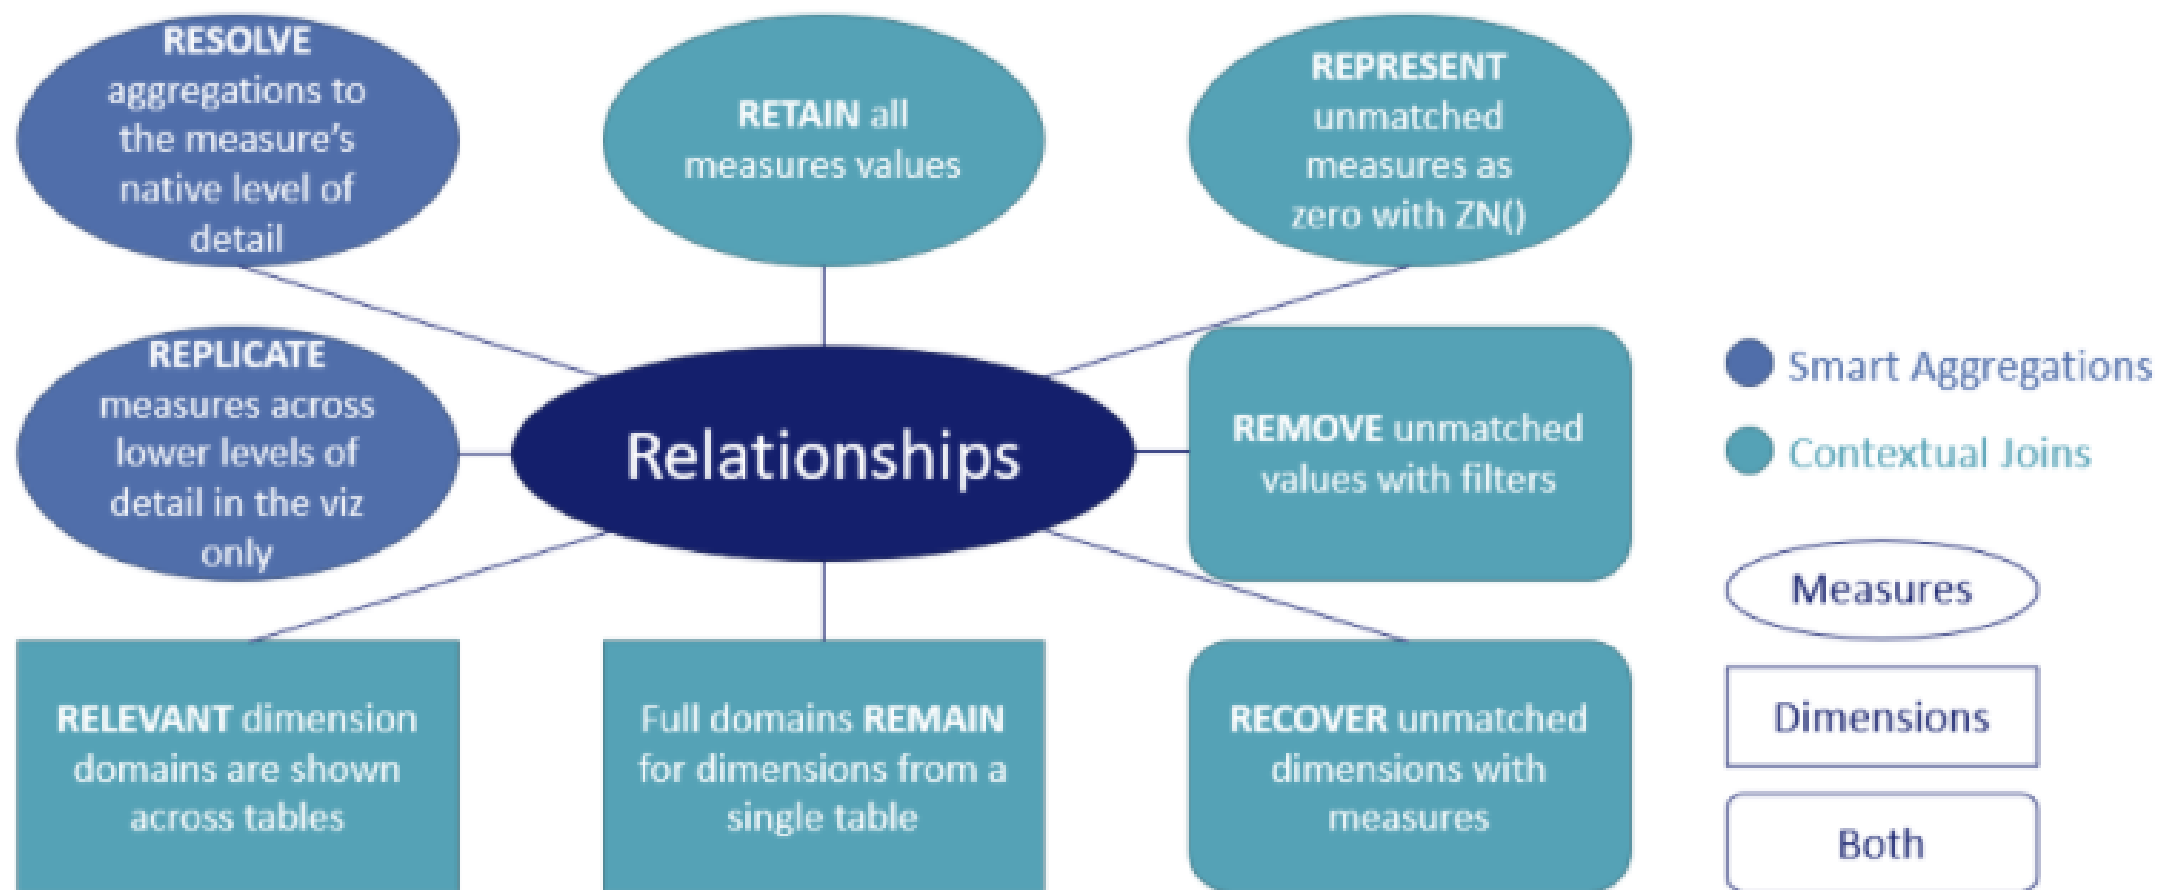

- Relationships are an easy, flexible way to combine data from multiple tables for analysis.
- You define relationships based on matching fields, so that during analysis, Tableau brings in the right data from the right tables at the right aggregation—handling level of detail for you.
- A data source with relationships acts like a custom data source for every viz, but you only build it once.

Relationships can help you in three key ways:

- 1. Less upfront data preparation:** With relationships, Tableau automatically combines only the relevant tables at the time of analysis, preserving the right level of detail. No more pre-aggregation in custom SQL or database views!
- 2. More use cases per data source:** Tableau's new multi-table logical data model means you can preserve all the detail records for multiple fact tables in a single data source. Say goodbye to different data sources for different scenarios; relationships can handle more complex data models in one place.
- 3. Greater trust in results:** While joins can filter data, relationships always preserve all measures. Now important values like money can never go missing. And unlike joins, relationships won't double your trouble by duplicating data stored at different levels of detail.

The 8 Rs of relationship semantics

- Tableau needs rules to follow—semantics—to determine how to query data. Relationships have two types of semantic behavior:
 - 1.Smart aggregations:** Measures automatically aggregate to the level of detail of their pre-join source table. This differs from joins, where measures forget their source and adopt the level of detail of the post-join table.
 - 2.Contextual joins:** Unmatched values are handled individually per viz, so a single relationship simultaneously supports all join types (inner, left, right, and full)
- With contextual joins, the join type is determined based on the combination of measures and dimensions in the viz, and their source tables.

Consider the Convenience_store datastore

Data Model Diagram

Customer Table

Customer ID	Customer Name
1	Doug
2	Sara

Transaction Table

Transaction ID	Transaction Date	Customer ID
1	May 31, 2020	1
2	May 31, 2020	2
3	Jun 1, 2020	1
4	Jun 1, 2020	

Transaction Detail Table

Transaction ID	Product ID	Quantity Sold
1	3	2
1	1	1
2	4	2
2	2	1
3	5	1
3	1	2
4	2	1
4	6	2

Product Table

Product ID	Product Name	Unit Price	Unit Cost	Category ID
1	Water	\$1.50	\$0.40	1
2	Juice	\$2.50	\$0.75	1
3	Magazine	\$3.00	\$0.80	2
4	Book	\$5.00	\$1.75	2
5	Potato Chips	\$1.50	\$0.50	3
6	Chocolate Bar	\$2.00	\$0.75	3
7	Pencil	\$0.50	\$0.10	4
8	Pen	\$1.00	\$0.40	4

Category Table

Category ID	Category Name
1	Beverage
2	Reading Material
3	Snack
4	Stationery

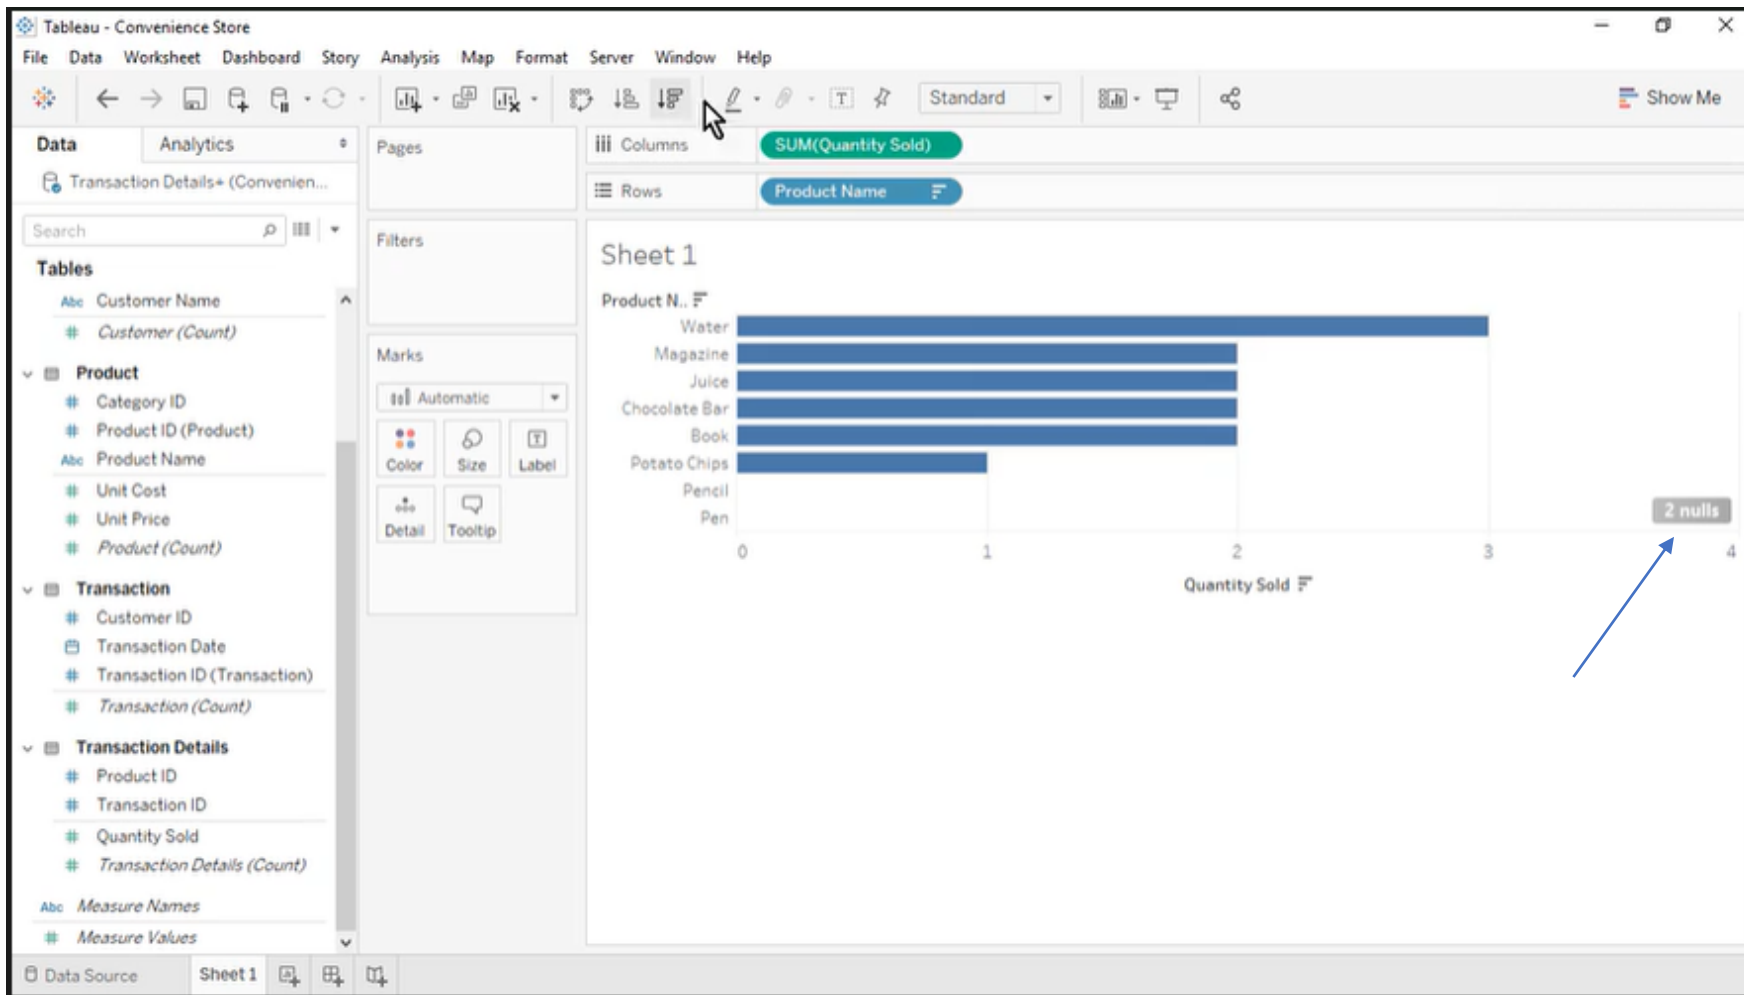

Drag the Convenience store

The screenshot shows the Tableau Desktop interface with a workbook titled "Tableau - Book1". The left sidebar contains a "Connections" pane with "Convenience Store" (Microsoft Excel) selected, and a "Sheets" pane with a list of data sources: Category, Customer, Product, Transaction, and Transaction Details. A "New Union" button is also visible. The main workspace displays a data source connection diagram for "Transaction Details+ (Convenience Store)". The diagram shows "Transaction Details" connected to "Product" and "Transaction", which are both connected to "Category" and "Customer". The "Customer" box is highlighted, and a mouse cursor is pointing at it. Below the diagram, there is a "Sort fields" dropdown set to "Data source order" and checkboxes for "Show aliases" and "Show hidden fields". A table preview shows the first two rows of data:

Customer ID (Cust...)	Customer Name
1	Doug
2	Sara

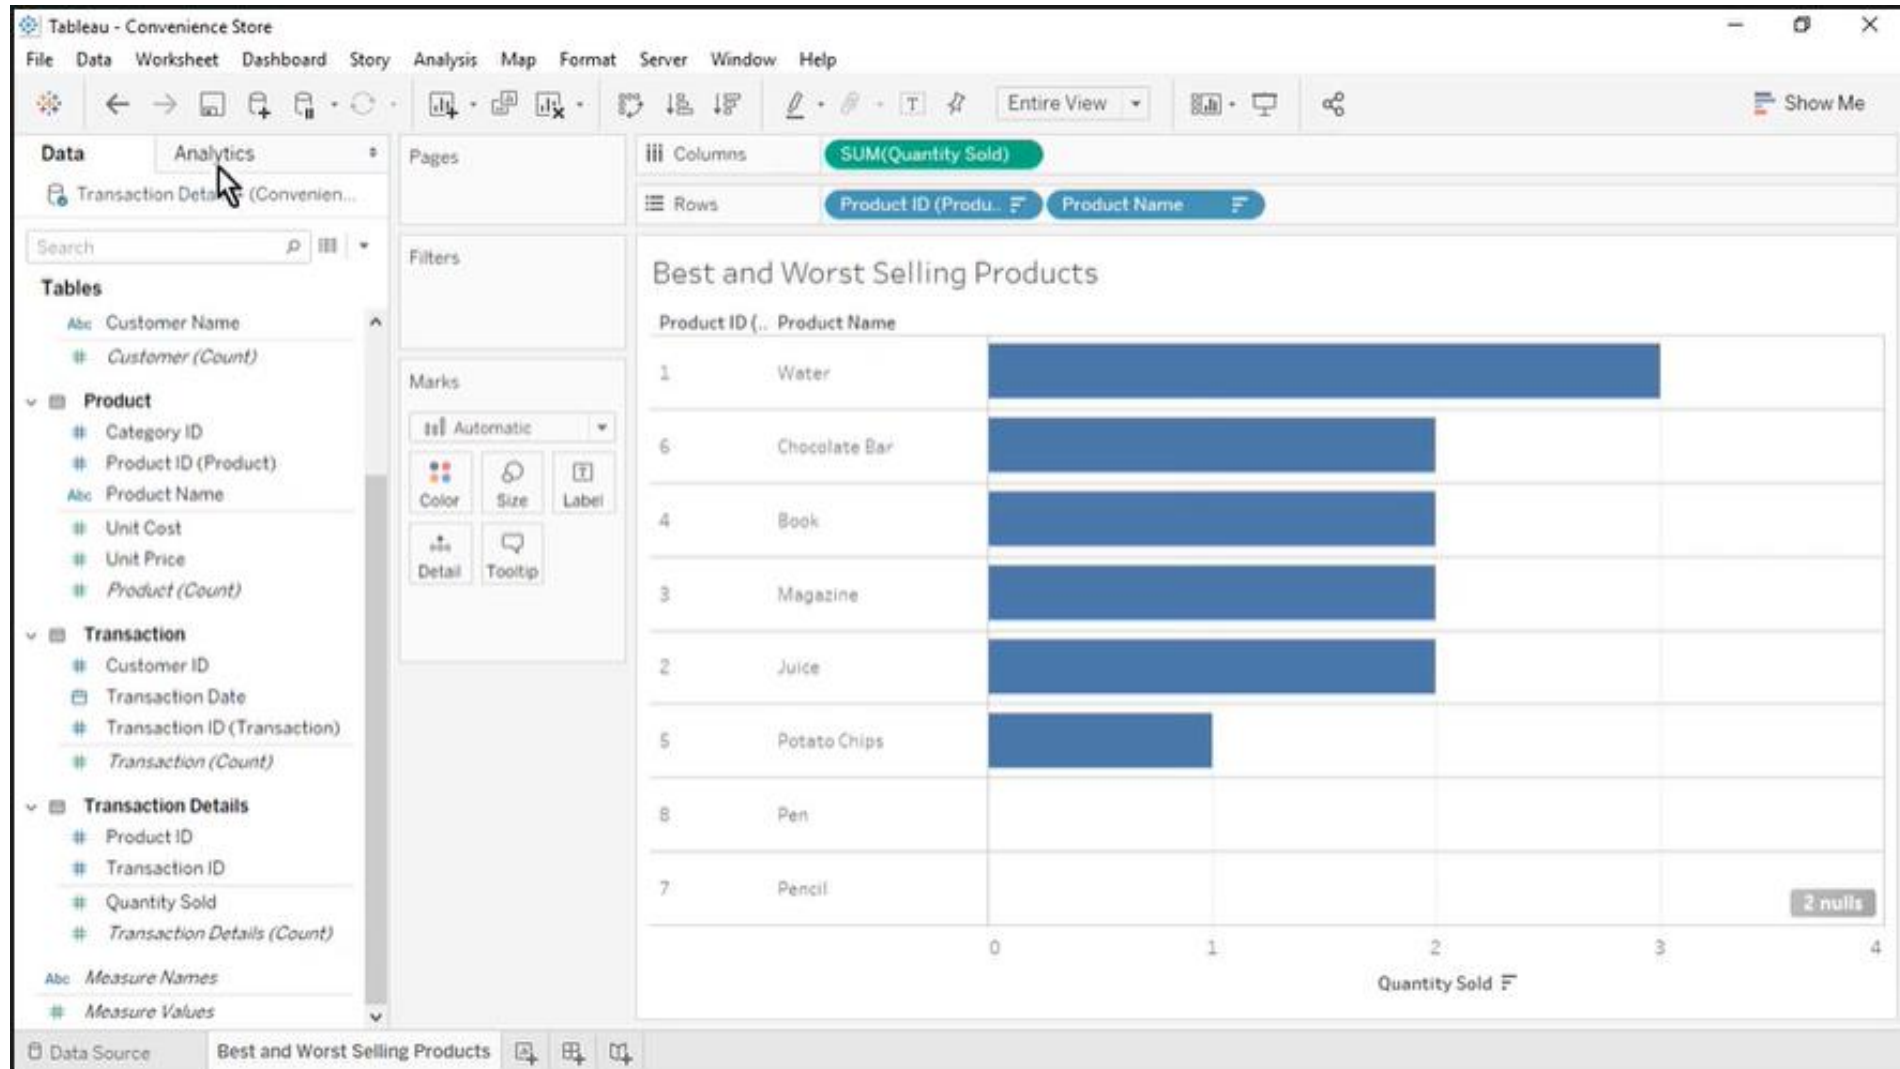

At the bottom, there is a "Go to Worksheet" button with a close icon.

Q1. What are our best and worst selling products? (Display Product Id also)

- The best selling product is water and worst selling product is pencil and pen.
- If you want to see only the products that are sold click on 2 nulls. A filter data will appear.
- Now we need to have productid. If we drag it from trans_detail table in the rows section, output is not correct so we need to drag it from product table.

Output

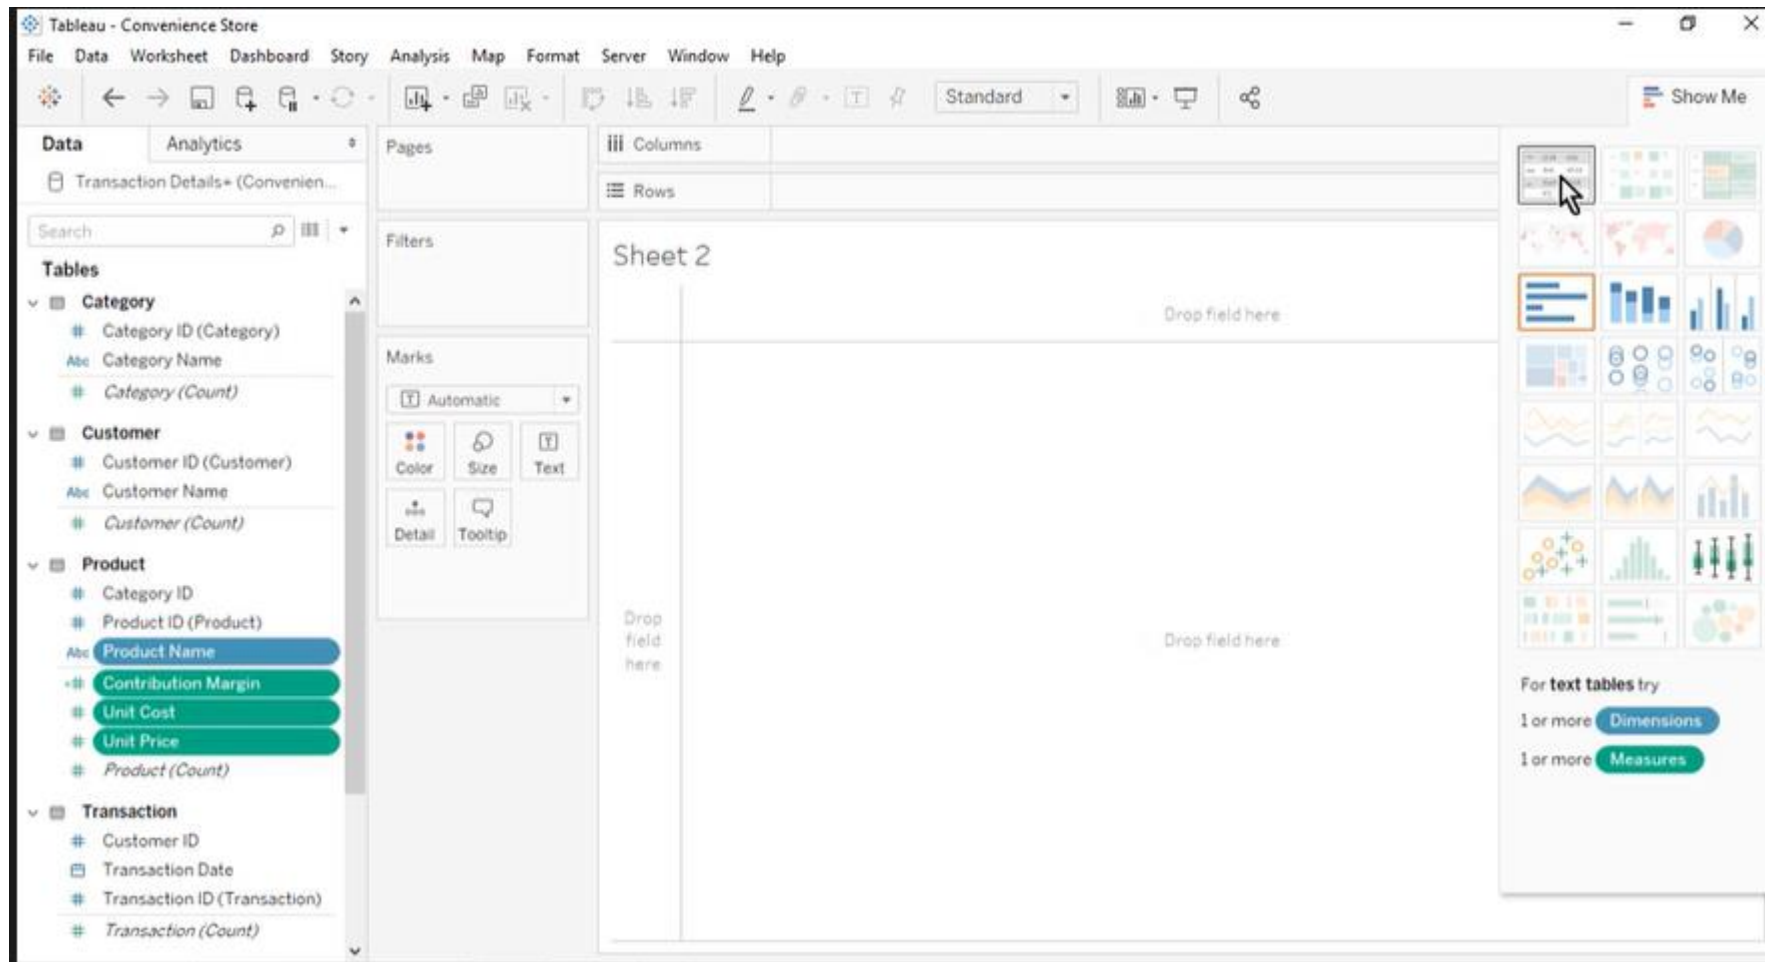

2. What was the contribution margin (CM) per product?

$CM = \text{Unit Price} \text{ minus } \text{Unit Cost}$

The image consists of three screenshots from the Tableau interface, demonstrating the steps to create a calculated field for Contribution Margin.

- Left Screenshot:** Shows the 'Data' pane on the left. An orange arrow points to the 'Calculated' column icon (a small square with a plus sign) in the 'Columns' shelf.
- Middle Screenshot:** Shows the 'Contribution Margin' dialog box. The formula '[Unit Price] - [Unit Cost]' is entered. The 'OK' button is highlighted.
- Right Screenshot:** Shows the 'Product' table in the 'Columns' shelf. The 'Contribution Margin' field is highlighted in green, and a blue arrow points to it.

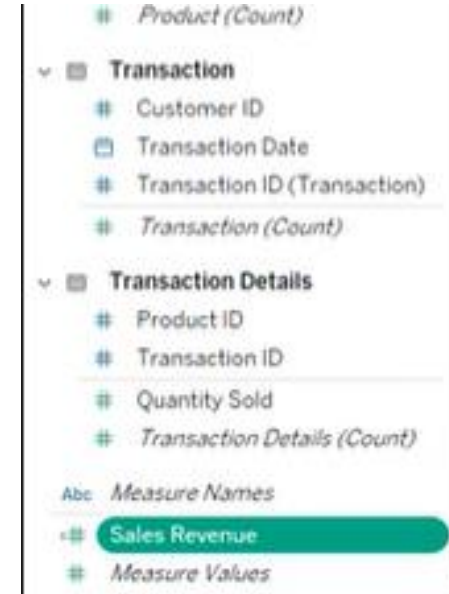

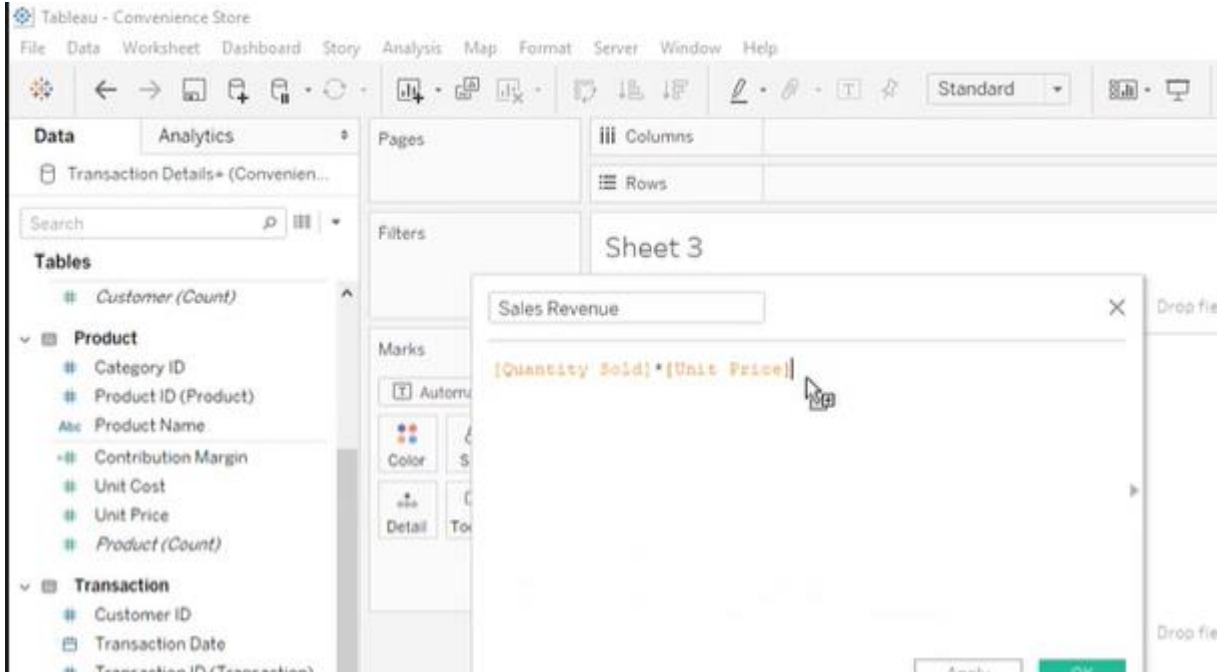

- Create a calculated field by clicking calculated column
- Give a name as contribution price. Drag unit price – and then drag unit cost. Press OK.
- You will notice that contribution margin appears in Product table
- Set the currency(standard) by clicking on the →Default properties → number format → Currency standard → OK

	Magi
	Pen
	Penc
	Pota

- Lets create a Text table
- Hold the ctrl key and select the options and select show me and select the text table
- Rearrange the columns as Unit cost, unit price and contribution margin
- The output can be checked

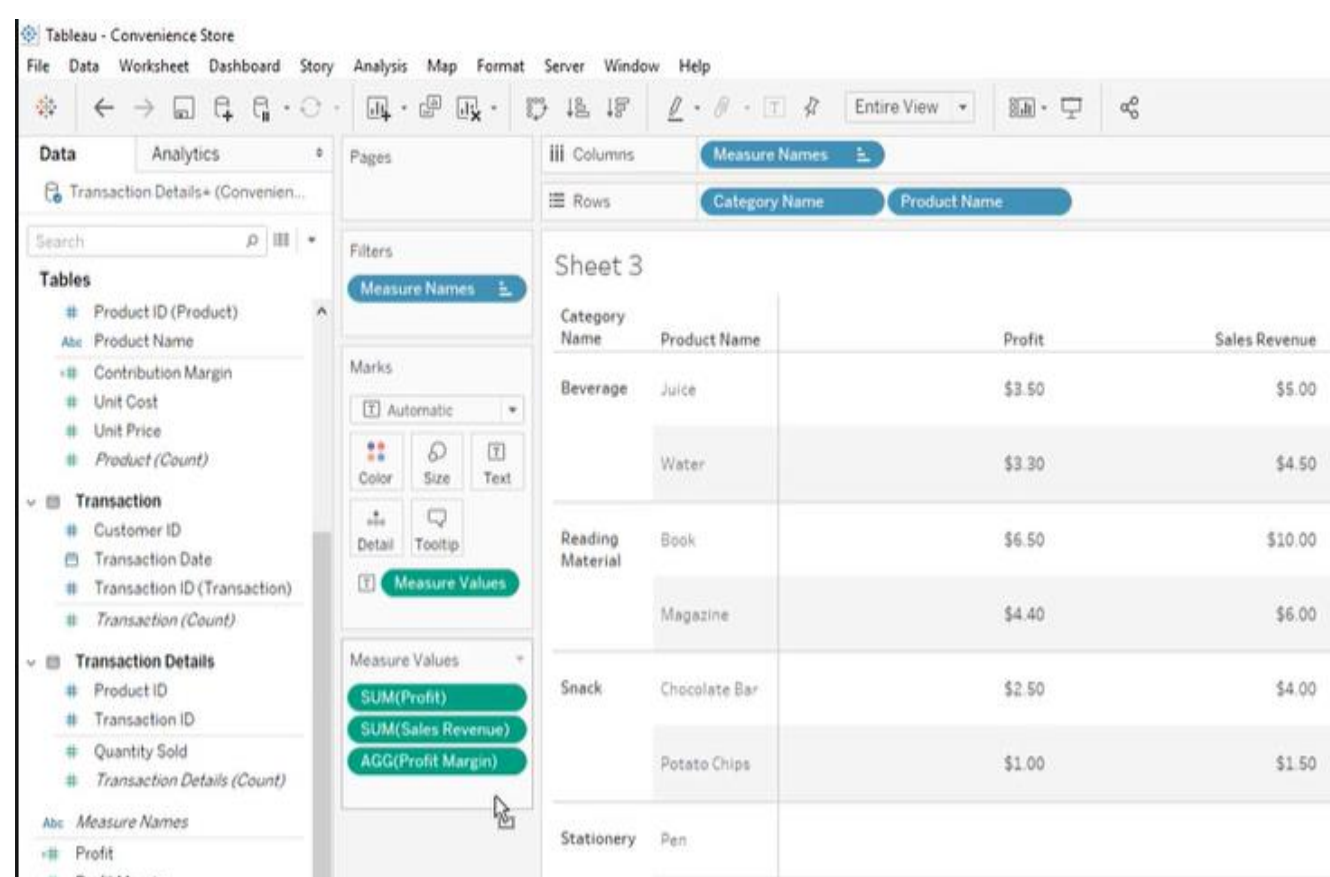

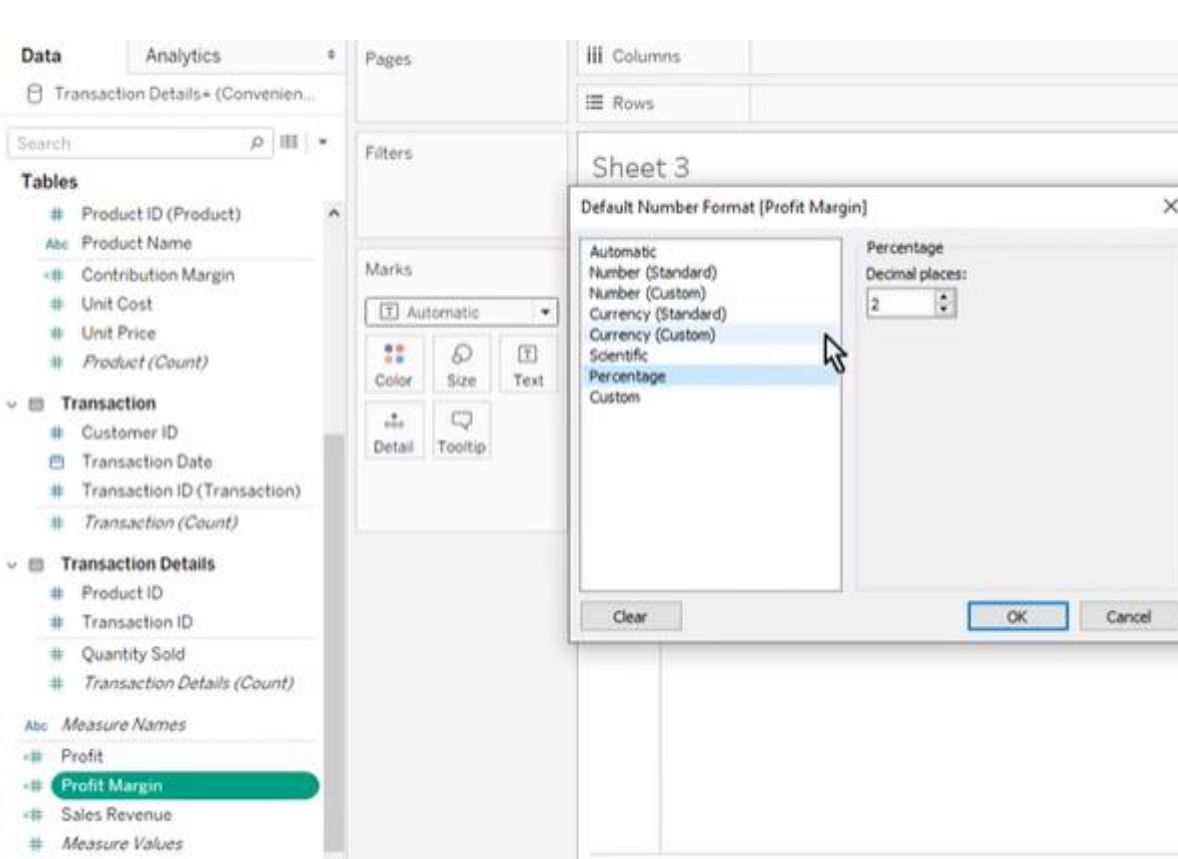

3. What were the sales revenue, profit, and profit margin per category and product?

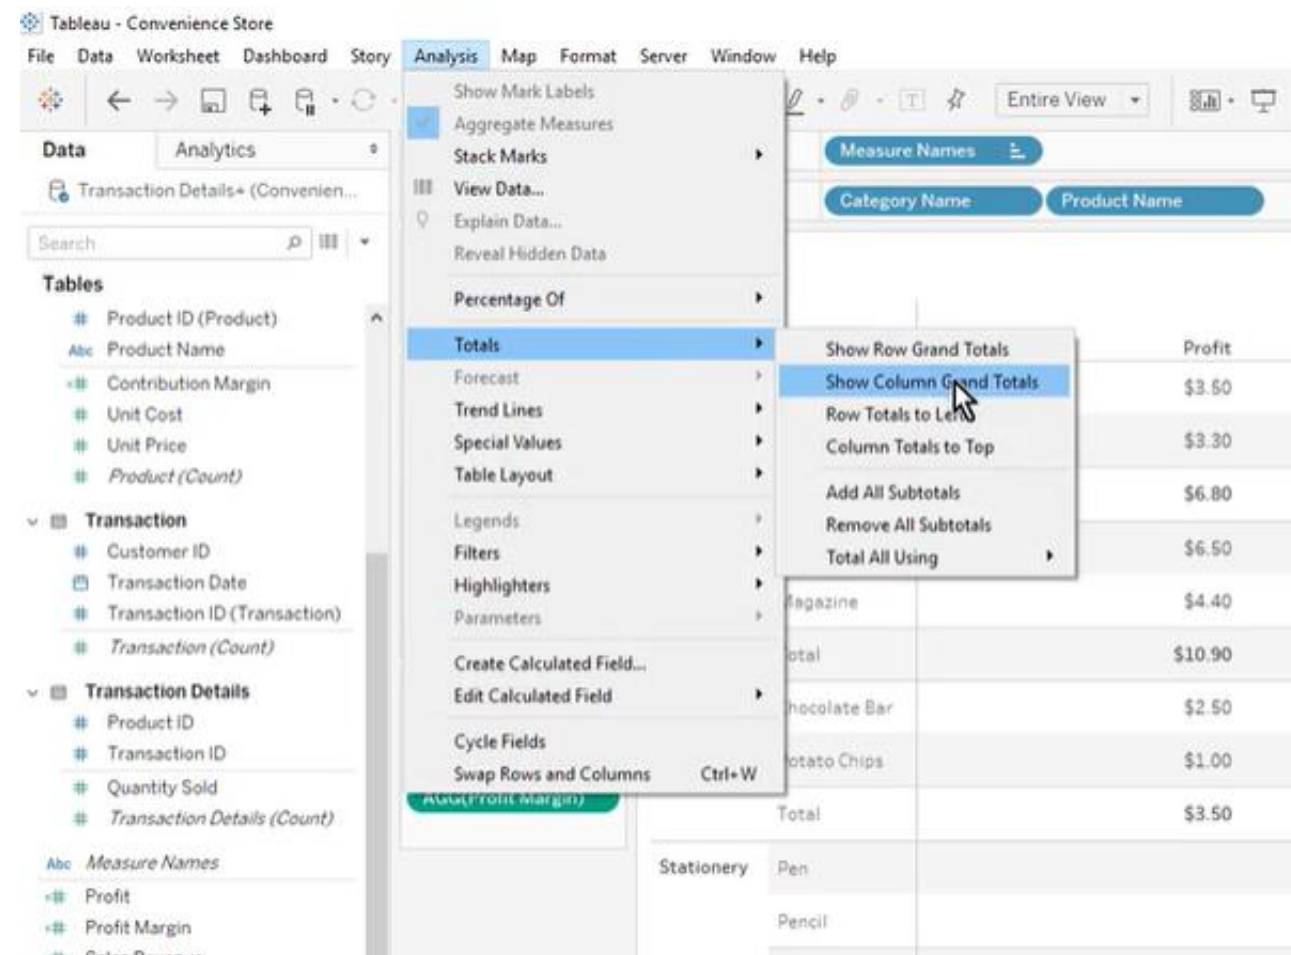

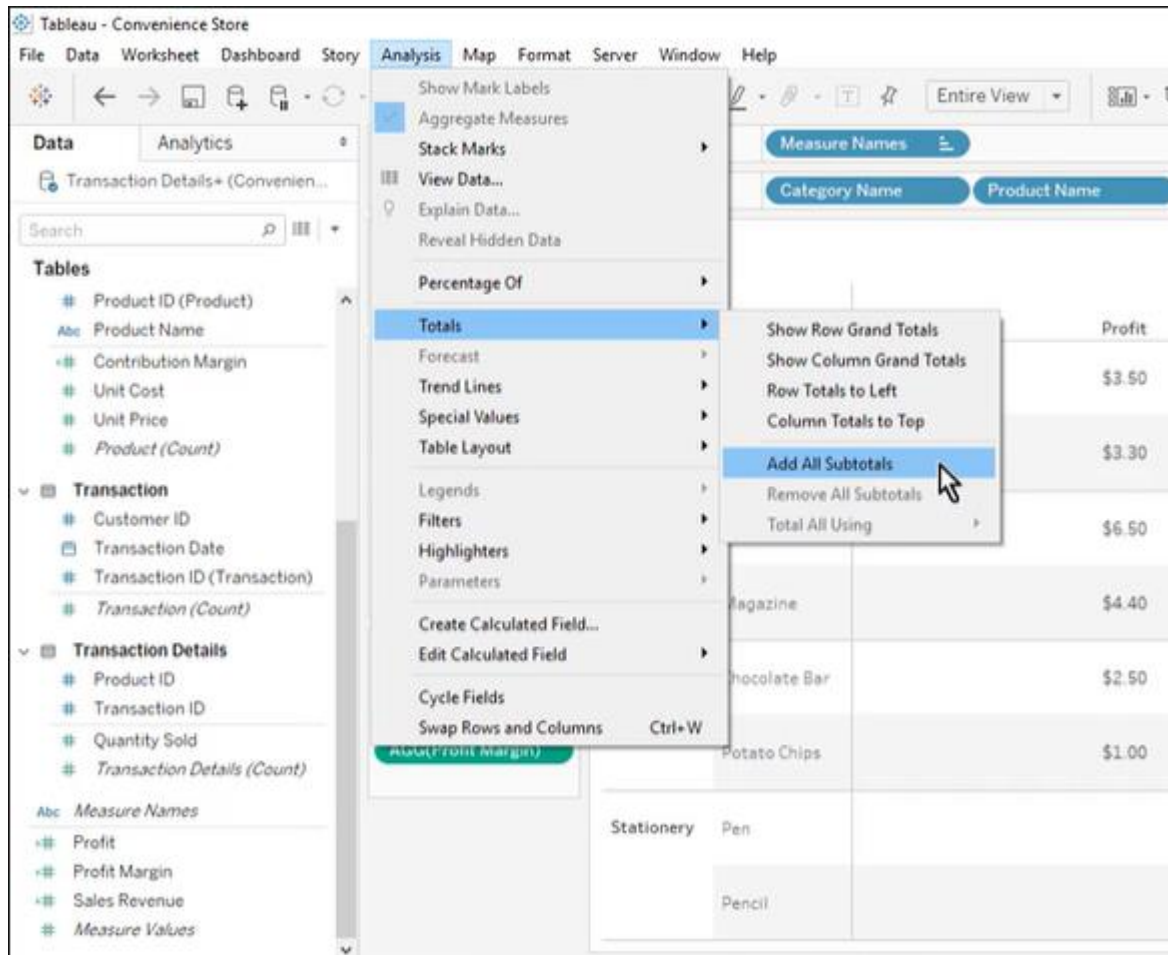

- We need to create 3 calculated fields:
 1. Sales Revenue= Qty sold*Unit Price
 2. Sales revenue will be created in separate tab not in the respective table as it is a value generated from two different tables.
 3. Set the currency(standard)

- We need to create 3 calculated fields:
 1. Now create the second calculated value:
Profit = QtySold*Contributonal Margin
 2. Profit will be created. Set the currency(standard)
 3. Now create the third calculated column: Profit margin= sum(profit)/sum(sales_reve)

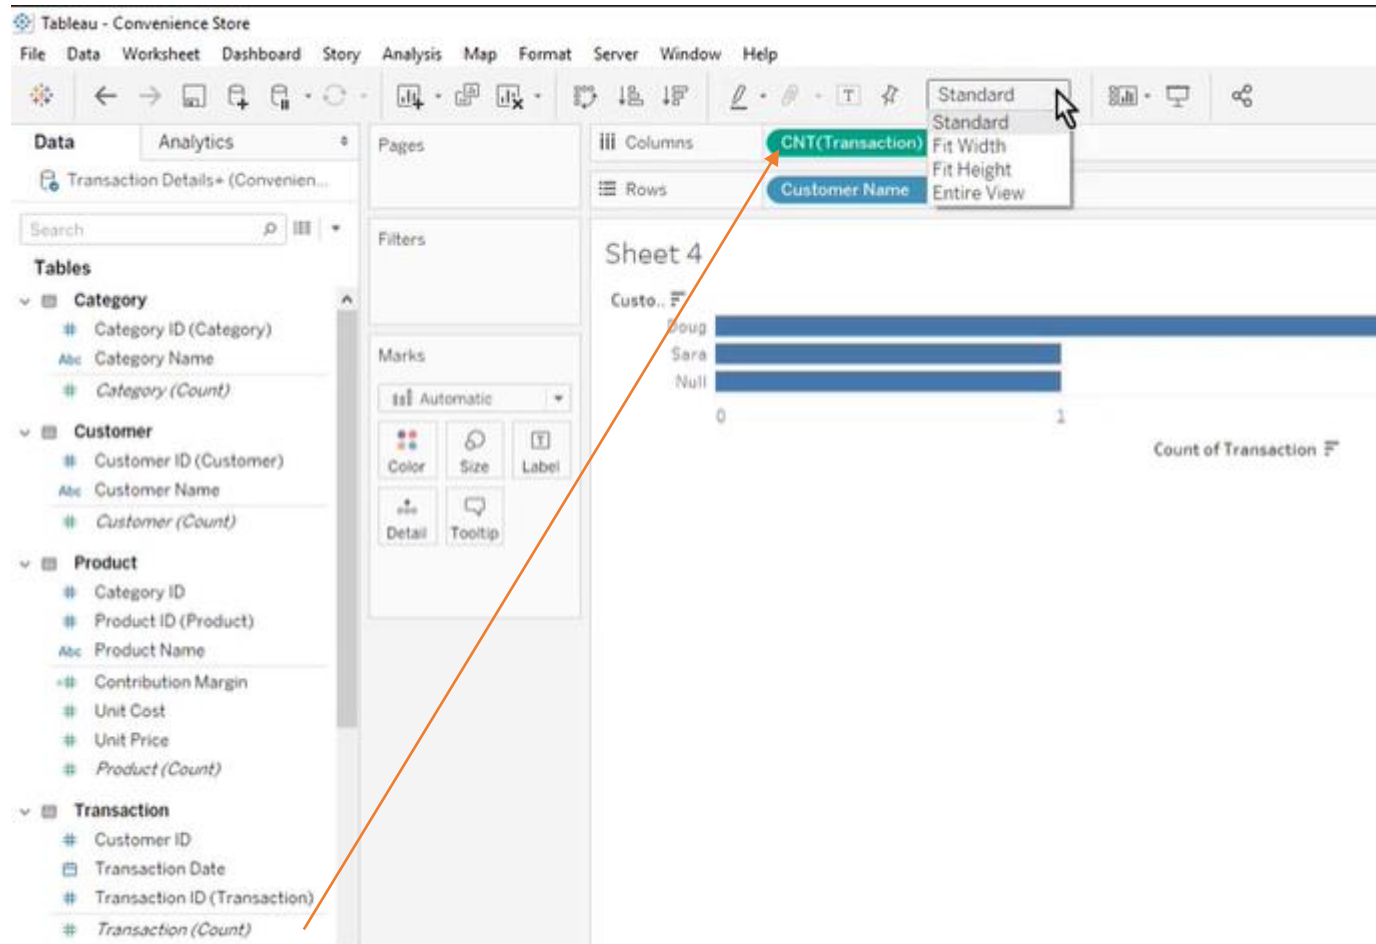

- Set the default format of profit margin, i.e. percentage to 1 decimal place
- Now press ctrl key and select Category name, product name, profit, profit margin and sales revenue.
- Click show me and select text table.
- Rearrange the measure values.

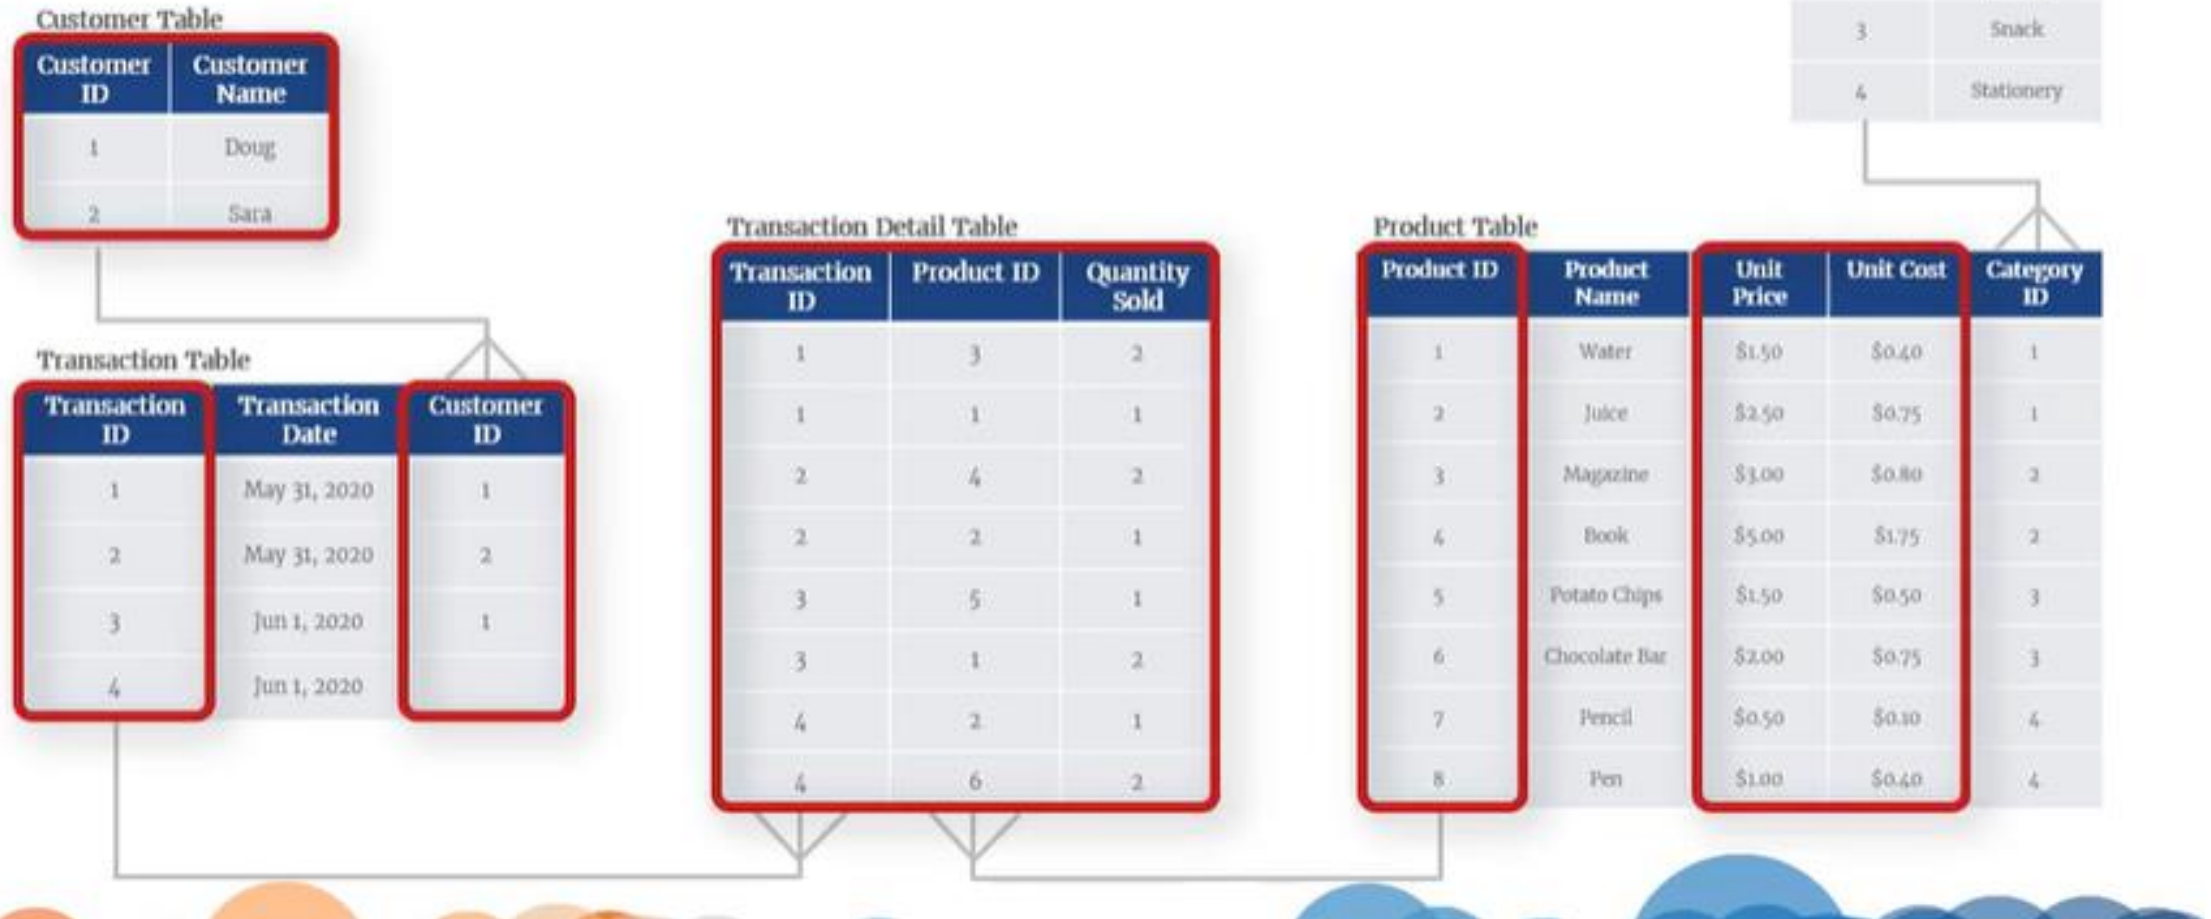

- To display the subtotal, click analysis->totals->add all subtotals
- We can display the grand total

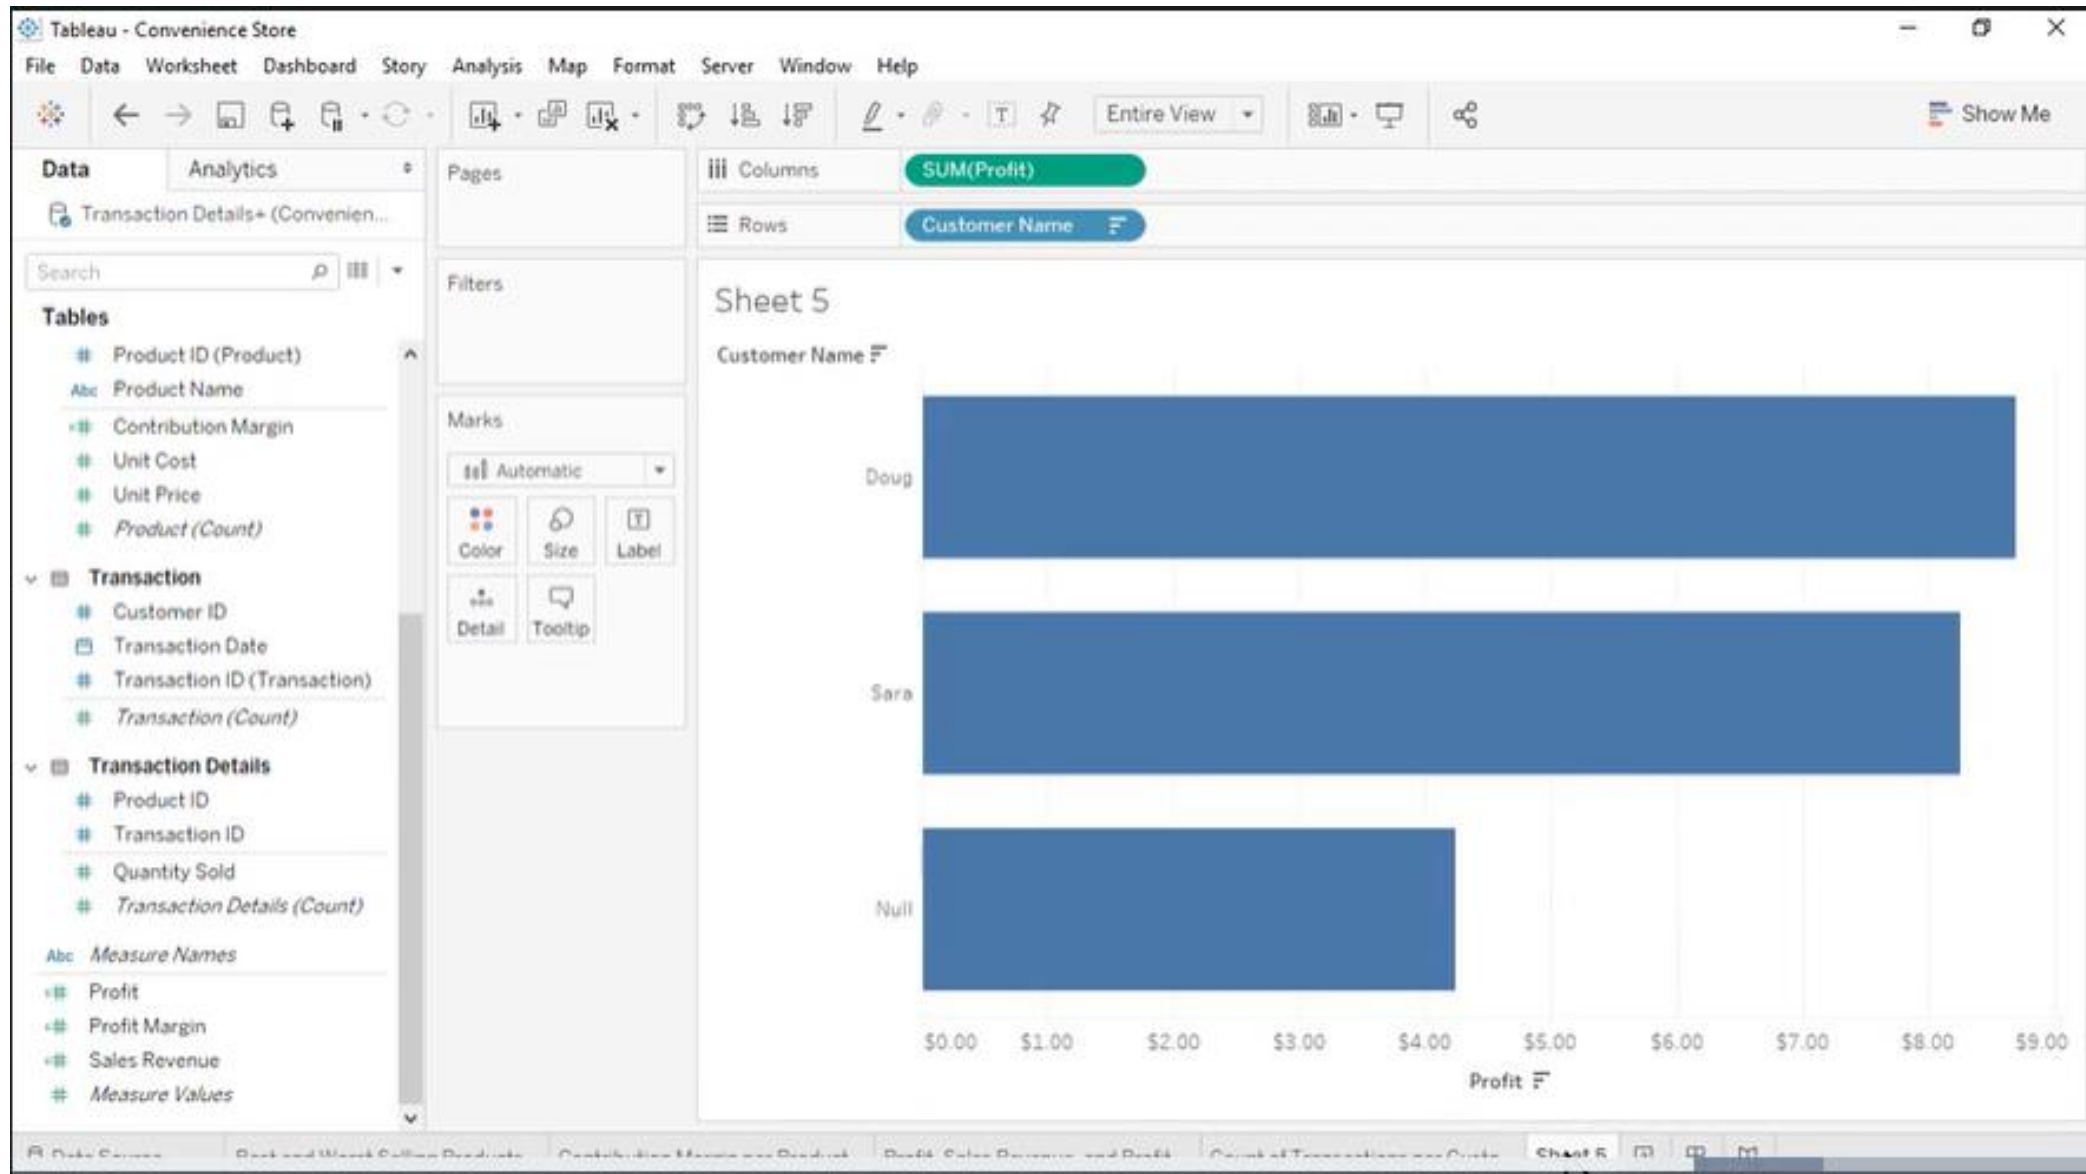

4. Who were our most frequent customers?

- Select Customer name, cnt(transact) which is automatically generated
- Sort it in descending order.

5. Who were our most profitable customers?

6. From which categories did each customer purchase? And in what quantity?

Customer Table

Customer ID	Customer Name
1	Doug
2	Sara

Transaction Table

Transaction ID	Transaction Date	Customer ID
1	May 31, 2020	1
2	May 31, 2020	2
3	Jun 1, 2020	1
4	Jun 1, 2020	

Transaction Detail Table

Transaction ID	Product ID	Quantity Sold
1	3	2
1	1	1
2	4	2
2	2	1
3	5	1
3	1	2
4	2	1
4	6	2

Product Table

Product ID	Product Name	Unit Price	Unit Cost	Category ID
1	Water	\$1.50	\$0.40	1
2	Juice	\$2.50	\$0.75	1
3	Magazine	\$3.00	\$0.80	2
4	Book	\$5.00	\$1.75	2
5	Potato Chips	\$1.50	\$0.50	3
6	Chocolate Bar	\$2.00	\$0.75	3
7	Pencil	\$0.50	\$0.10	4
8	Pen	\$1.00	\$0.40	4

Category Table

Category ID	Category Name
1	Beverage
2	Reading Material
3	Snack
4	Stationery
